SUPPLY CHAIN OPTIMIZATION / FREIGHT MANAGEMENT

Shipping to UPS, FedEx and DHL Without the Double Entry

Connect your Infor LN or Baan system directly to UPS WorldShip, FedEx Ship Manager and DHL. Compose, confirm and track shipments, check pallet assignments and update freight details in one flow, so you ship faster, more accurately and without re-keying a thing. Powered by RMCship.

What is RMCship

RMCship provides complete one-way or two-way communication between your Infor LN or Baan system and UPS WorldShip, FedEx Ship Manager or DHL. Rather than manually re-entering shipment details across systems, RMCship interfaces directly to your sales orders, optionally inserting a freight line and automatically writing back freight amount, freight type, quantity shipped and tracking ID as shipments move. The result is one connected shipping process, with tracking IDs, pallet assignments and freight details all flowing back to your ERP automatically.

Common Shipping Challenges

- **Manual double entry** – Re-keying shipment details between your ERP and carrier systems wastes time and introduces avoidable errors.
- **Disconnected freight data** – Without a direct interface, freight amount, tracking IDs and pallet assignments live in separate systems instead of flowing back to a single source of truth.
- **Limited shipment visibility** – Without one connected process, your team and your customers can struggle to know exactly where an order stands.

If your team is still manually re-entering shipment details between your ERP and your carriers, it's time to connect that process. RMCship gives you one automatic flow from sales order to carrier and back, so you ship faster, catch issues before they reach the dock and always know where an order stands.

What You Can Do with RMCship

One Connected Shipping Process

Compose, confirm and track shipments to UPS, FedEx and DHL straight from your Infor LN or Baan system, with freight amount, type, quantity shipped and tracking IDs flowing back automatically.

Fewer Errors, Less Manual Work

Cut the manual steps between your ERP and your carriers, so you catch and correct potential issues before they reach the dock.

Full Shipment Visibility

Keep tracking IDs, pallet assignments and freight details in one place, so your team and your customers always know where an order stands.

Extensive Historical Tracking

Built-in exception reporting and historical tracking help you identify and correct potential issues immediately.
